Standard for Acquisition and Assessment of Technology Systems
Version 1; September 2020

PURPOSE:
This standard outlines the process for requesting new systems and uses of technology at JMU regardless of their cost. The process will be used to evaluate new systems as well as current systems that are being expanded or renewed.

DEFINITIONS:

Higher Education Community Assessment Tool (HECVAT): The HECVAT is a questionnaire framework specifically designed for higher education to measure vendor risk. Prior to the purchase of a third-party solution, the vendor completes a HECVAT to confirm information, data, and cybersecurity policies are in place to protect sensitive institutional and constituent data. JMU prefers the full (vs. lite) version of the HECVAT. For easy use, a copy is available here along with other HECVAT tools.

SOC 2: A Service Organization Control 2 (SOC 2) is an auditing procedure conducted by an independent third-party auditor to ensure service providers securely protect the data and interests of the institution. A SOC 2 reports on various controls of the service organization related to security, availability, processing integrity, confidentiality, and privacy. JMU prefers the SOC 2, Type 2 for its assessments; however, other types of SOC reports may be acceptable.

System Classification: A classification assigned to a system for risk management and security purposes based on the sensitivity level of the data as well as the impact to the university should the data be improperly disclosed, altered, or destroyed without authorization. System classifications are assigned by Information Technology with input from the data manager(s). A system may receive a classification of 1 – 4 with class 1 being assigned to systems containing highly confidential data, classes 2 and 3 for protected data, and class 4 for public data.

Technology Solution Request (TSR): The form in the IT Customer Portal that faculty and staff use to submit their requests for technology solutions.

STANDARD:

These standards outline the general flow and requirements associated with the assessment of new and existing technology solutions.

1. Pre-Planning:
Those planning for new technology systems must begin early and give up-front consideration to the following items:
• **Existing solutions:** See if there is something already on campus that meets the need (if so, consider using it or be prepared to justify the need for a new product).

• **Funding:** Validate that a source of funding is available (be sure to consider initial purchase costs as well as on-going/cost to continue requirements).

• **Approval:** Department head approval is required when a Technology Solution Request (TSR) is submitted.

2. **Technology Solution Request:**

• **Use Case:** Describe the need the solution fulfills including the following elements:
  
  o **Purpose:** Describe the general purpose of the system.
  
  o **Features:** What specific functionality does the system provide?
  
  o **Data:** What data will be collected/processed using the system (provide a detailed list)?
  
  o **Data sources:** Explain the data sources that will be used (e.g. the data will be manually entered, the data will come from another system).
  
  o **Integrations:** What other connections or integrations are required (e.g. the system will use credit processing, the system will connect to Canvas, etc.)?
  
  o **Audience:** Who will be using the system (fully identify the population or population subset of students, faculty, staff or others who will need access)?
  
  o **Special Needs:** Any special access requirements or other needs (e.g. the students using the system will need to maintain access post-graduation)?
  
  o **Estimated cost:** How much will the system cost and how will it be billed (e.g. a one time, annually, monthly, by use, etc.)?

3. **System Classification:**

Once the TSR is received, an IT Sponsor will be assigned to work with Procurement and help shepherd the risk assessment process within IT. The IT Sponsor will also work with the appropriate university data manager(s) to evaluate the data management and other compliance requirements that may be associated with the system and apply a system classification (1-4).

4. **Acquisition:**

Regardless of cost and whether the system will be acquired through small purchase, existing contract or competitive procurement, the requester should consult with JMU Procurement for advice on purchase and licensing options.

In no case shall individuals sign or otherwise agree to licensing terms or contract documents on behalf of the university.

5. **Risk Assessment:**

As the acquisition process begins, IT is required to complete and document an IT Security Risk Assessment. The level of assessment necessary is based on the system classification. Based on the classification, the requester will work with the vendor to collect and share with IT the necessary risk assessment documentation as follows:

<tr>
<td><strong>Data Control Procedures:</strong> Since Class 1 Systems contain highly confidential data that needs special treatment, the department must work in conjunction with IT and the appropriate data manager(s) to develop special handling procedures describing how the department will meet necessary compliance requirements. Primary examples include those regarding:  - Protected Health Information (PHI) covered by HIPAA  - Credit card processing  - SSN and other highly confidential data  To better understand these requirements, the department should email <a href="mailto:ISO@jmu.edu">ISO@jmu.edu</a> for assistance.</td>
<td></td>

</table>

---

ISO@jmu.edu for assistance.
As IT completes the system risk assessment process and necessary mitigations are identified, they will be returned for acceptance and implementation. If at any point during implementation, it becomes apparent that the mitigations cannot be realized, the system owner must consult IT for assistance.

Depending on the scope and complexity of the system, potential risks surrounding it and to preserve continuity of operations, IT reserves the right to set additional requirements or take on central management of any university system.

6. On-going Risk Management:
To help ensure appropriate risk management continues over time, system owners are required to contact IT prior to any additions or changes to systems after they are acquired and to fully participate in collecting information necessary to support annual system reviews by IT.

PROCEDURE:

Provided the necessary information is made available, IT will process Class 3 and 4 Systems as soon as practical using an abbreviated Ops Review assessment process. This generally occurs within a minimum of 2 weeks after TSR receipt.

For Class 1 and 2 Systems, IT will not schedule the risk assessment until the necessary documentation is available and the system classification is confirmed (and in the case of a competitive procurement (RFP), until the preferred viable candidate(s) are identified). Requesters should allow at least 4 weeks after IT has received the necessary documentation for the risk assessment process to be completed.
